

Old Photo Restoration II

In this project you will convert a color image into a black and white, add selective color and apply a filter to the background.

1. Scan in your original photograph.
2. Move to another computer.
3. Open your saved image and Image change Mode from RGB to Grayscale.
4. Save as YOUR NAME 2.
5. Remove any scratches and blemishes from the photograph with the rubberstamp tool.
6. Also remove an object from the background.
7. Save as Your Name 3.
8. Convert the image back to the RGB mode.
9. The photo will look a little gray so Image Adjust Curves. Move the slider along the line to change the contrast.
10. Select an article of clothing. Change the color. Be sure to change the opacity of the painting tool you choose so the color is not too strong.
11. Repeat step 9 for two other pieces of clothing and for at least 3 objects in the background. Save.
12. Using the quick mask, mask out the primary image in the photograph (the subject).
13. Apply a Filter effect to the background.
