

# Move yourself

High, low and unusual angles add life to photos

Look at the **obvious** photo assignment and find a way to make it more **interesting** to the human eye. Some techniques are featured here.

**Jars of light**, top, show specimens in natural window lighting with the camera perched on the lab table... **Peeking down** at a study session, the stair rail adds a dimension to the bird's eye angle of view....**Getting a leg up** on repetition of shapes just goes to show that repetition can be found virtually anywhere. A worm's eye view adds to the uniqueness of the photo.

**Framing a phone** call shows a librarian from the stairway... **Speaking of tomatoes**, a little color adds interest to a science lab shot...**Through the trees**, people are framed while your eye is drawn to them by the curved sidewalk. Notice how the subject illustrates the rule of thirds

## Proper positioning

There is no right or wrong way to shoot a picture. But being flexible is important, whether it is shooting a subject through a mirror, laying on your back or crouching down.
